Services

When connected to AREDN, individuals can run different services on individual servers like a Raspberry Pi or a cheap Linux computer. Note that these services are only visible when connected to AREDN and are **not** accessible to the wider internet. A few examples we have running right now are:

Linux Server	A prerequisite to running many other services on a Raspberry Pi or other Linux computer.
Mesh Chat	Different instances of this chat service can sync with one-another.
Nextcloud	A file sharing and sync'ing service.
VOIP phone network	One-to-one or conference calls using extensions
Winlink Gateway	Winlink messages over AREDN
FlightAware Tracker	Listening to local airplane transponder to track them.
MeshMap
