

COVID-19 Spread

I'm not an epidemiologist, doctor, or any kind of expert on the subject so take this with a grain of salt.

One of the key messages from today's PM announcement is that things will get worse before they get better. I wanted to have a sense of the rate at which COVID-19 is spreading in Canada, so I made a graph, and did some math.

First, I got the data from <https://www.covid-19canada.com>, plotted it on a graph, and tried to use a basic exponential model to extract some basic information.

Date	Count
2020-03-02	27
2020-03-03	27
2020-03-04	33
2020-03-05	37
2020-03-06	48
2020-03-07	60
2020-03-08	64
2020-03-09	77
2020-03-10	95
2020-03-11	117
2020-03-12	157
2020-03-13	201
2020-03-14	254
2020-03-15	342

It turns out that there's two different patterns in this two-week period:

- Between March 2 and March 10 (ish) (**green line**), the number of cases was doubling every 4.1 days
- Between March 10 (ish) and now (**blue line**), the number of cases is doubling every 2.7 days

The formulae for the exponential curves are:

- $24.5 \times 2^{\left(\frac{t}{4.1}\right)}$ for the green line (where t is the number of days since March 2)
- $93.1 \times 2^{\left(\frac{t}{2.7}\right)}$ for the blue line (where t is the number of days since March 10)
