

PicoAPRS

Described as the “World's smallest APRS Transceiver by DB1NTO”, the [PicoAPRS](#) can be used as:

- a tracker that can send position data
- a receiver that can receive APRS messages
- a stand alone APRS digipeater
- a computer connected TNC

Here are some screenshots:

It outputs 1W and you'll need to buy a separate antenna. The PicoAPRS's antenna port is a female SMA port (so you'll need an antenna with a male SMA connector), so Baofeng antennas won't work.

[DX Engineering](#) sells it for \$220 and the user comments there are pretty informative. The gist is that unless you're in an area with lots of digipeater, using this unit with a portable antenna and its meagre 1W won't work as a mobile APRS station. However, people have used it as trackers for drones or even drone APRS digipeaters

It's pretty cool, but I can think of a lot of other things I'd spend \$220 before buying this (unless I had a drone I guess).
