

# Wiki Update COMPLETE

For the past month or so, some of you might have noticed this banner at the top of the wiki when you log in<sup>1)</sup>:

-  New release available: 2022-07-31 "Igor". [upgrade now!](#) [52.2] ([what's this?](#))
-  New release candidate 2 available: rc2022-06-26 "Igor". [upgrade now!](#) [52.1] ([what's this?](#))
-  New release candidate available: 2022-06-26 "Igor". [upgrade now!](#) [52] ([what's this?](#))

It indicated that a new update of the wiki engine is available. I had been waiting for the stable release to be available instead of the release candidate (rc) and it looks like it is now. I finished testing this upgrade on a local copy of our website to make sure that it didn't break anything (it did). The old version we were using was from 2020-07-29 (2 years ago!) so there was some incompatibilities with extensions we were using. Luckily I found alternatives and completed the upgrade. Let me know if you notice anything unusual.

## Issues

I found some issues that needed to be fixed before I could proceed with the wiki upgrade.

Issue	Fix
The BlogTNG options used to post a news item on the front page are missing. The <a href="#">plugin page</a> and <a href="#">github page</a> haven't been updated in years, indicating that it's no longer being maintained.	Remove BlogTNG and replace with the following plugins instead: <ul style="list-style-type: none"> <li>* <a href="#">Blog</a></li> <li>* <a href="#">Include</a></li> <li>* Old version of <a href="#">Pagequery</a> (see <a href="#">Issue description</a>)</li> </ul> There will be slight changes in functionality.
Some template changes were reverted.	Re-implement the changes <a href="#">listed here</a> , which need to be sequenced with permission reset.

## Plan

Steps	Status
Backup the current site	✓
Install the new plugins and convert the News Feed away from BlogTNG	✓
Uninstall BlogTNG	✓
Upgrade the Wiki	✓
Reset the permissions	✓
Re-implement the template changes	✓
