Quansheng UV-K10

Quansheng has a new radio and the feature list looks pretty impressive:

- APRS (Optional)
- Si4732 Receiver (Optional)
- Multi-Band TX/RX
- AM/FM/SSB/CW Reception
- High Power Output
- RGB Display | Multiple Color Options
- Bluetooth Programming
- 2500mAh Battery
- Dual Type-C Charging

From the Tiengu website, it looks like the price is roughly $100 USD without the optional APRS and Si4732 Receiver, but I couldn't figure out a way to add those options to the cart.

I wrote about the Quansheng UV-K5 I got last year and how I flashed a different firmware on it. I'm not sure if that'll also be possible with the K10, and as of today, Chirp doesn't seem to support it either.
