IC 7300 Settings for Digital Modes

This page describes how to adjust the settings on the IC-7300 to use digital modes like FT8, JS8, or Winlink. To make it convenient to switch between digital and voice, we use an SD Card to save the settings and load them up when needed.

So before doing anything, let's backup the current settings in case something goes wrong:

- Insert an SD Card in the radio.
- Go to MENU \rightarrow SD Card
- The first time, Format the card. This will erase everything on the card.
- Press Save Setting \rightarrow New File \rightarrow Pick a file name.

Later on, these settings can be applied using the Load Setting option.

Connector Settings

Now that the settings are backed up, lets tweak a few things.

VA7FI has the following settings on his radio. The settings in light grey are there for reference only and can be different, but the settings in black should probably match.

	Digital	Voice	
$MENU \rightarrow SET \rightarrow Connectors:$			
ACC/USB Output Select	AF		
ACC/USB AF Output Level	40%	50%	
ACC/USB AF SQL	OFF (Open)		
ACC/USB AF Beep Speech Output	OFF		
ACC/USB IF Output level	50%		
ACC MOD Level	50%		
USB MOD Level	35%-40% ¹⁾	50%	
DATA OFF MOD	MIC/ACC		
DATA MOD	USB		
$MENU \rightarrow SET \rightarrow Connectors \rightarrow CI-V:$			
CI-V Baud Rate	Auto		
CI-V Address	Note it	N/A	
CI-V Transceive	ON		
CI-V USB→Remote Tx Address	N/A		
CI-V Output (for ANT)	OFF		
CI-V USB Port	Link to [REI	NOTE]	
$MENU \rightarrow SET \rightarrow Connectors:$			
USB Serial Function	CI-V		
$\underline{MENU} \rightarrow SET \rightarrow Connectors \rightarrow USB \text{ SEND Keying}$			
USB SEND	RTS	OFF	
USB Keying (CW)	OFF		

USB Keying (RTTY)	OFF
Inhibit Timer at USB Connection	ON

Filter Settings

Next, we adjust the filter width:

- Press the FIL1 (or FIL2 or FIL3) button at the top of the screen (above the frequency) and select FIL1.
- Press and hold FIL1 (yes, the same button as before).
- Press the BW button and turn the VF0 knob until it says "3.6k"
- Then turn the inner and outer TWIN PBT knobs (top left) to adjust the boundaries to 600 and 2600 (even though the picture shows 650 and 3400).²⁾
- Optionally, press FIL1 again to also customize FIL2 and FIL3 in the same fashion.
- When done, press the MENU button and select the screen you usually like to see (SCOPE, METER, etc)

×

Digital and Voice settings

Let's now set settings that will be specific to the voice and digital modes.

Start by adjusting all the settings in the Voice column:

Mode	Digital	Voice	
Defaut Frequency	7.078.00 USB-D	3.729.00 LSB	
MUTI (select and turn the knob)			
RF POWER	30%	100%	
MIC GAIN	40%		
COMP	N/A	ON 4	
MONITOR	ON 12%	OFF 12%	
FUNCTION			
P.AMP ATT	OFF		
AGC	OFF	MID	
NOTCH	OFF		
NB	OFF	Depends	
NR	OFF	Depends	
IP+	OFF		
VOX	OFF		
СОМР	N/A	ON	
1/4	OFF	WIDE	
MONI	ON	OFF	

• Now save the settings to the SD Card and call the file 1Voice

Before we set the digital settings, move on to the next section and come back here after.

ACG Adjustments

For digital modes, we don't want any ACG:

- Pick a clear frequency.
- Press FUNCTION button.
- Press and hold the AGC button.
- Select the FAST button and turn the VFO knob until it reads 0FF.
- Optionally, set the MID to 0.3s and the SLOW to 2.0s.
- Press MENU and select SCOPE, or METER, or ...

Now that the ACG is set, go back to the previous section and apply the settings in the Digital column. When complete, save to the SD card under the name 2Digital.

Loading Settings

To load the settings: $MENU \rightarrow SET \rightarrow SD$ Card \rightarrow Load Setting \rightarrow 1Voice or 2Digital \rightarrow ALL \rightarrow YES and restart.

1)

Change the USB MOD Level to adjust the ALC, which should be about 2/3 in the red when transmitting.

The filter boundaries can be tweaked anytime on the fly to filter out unwanted signals at the edge of the band. This is useful if say you've got strong RTTY signals activating your a AGC, thus reducing the strength of the signals you're interested in.
