

# Linux Server

## Prerequisites

Running a home Linux Server on AREDN is very easy.

- You can install [LinuxMint Xfce](#) on a cheap laptop.
- Update it and reboot if necessary.
- Change the Linux hostname. For example, I used VA7FI-Linux:

```
sudo hostnamectl set-hostname VA7FI-Linux
```

Note that the Linux hostname will become the AREDN Node name in the Basic Setup page and the Mesh Chat Node name.

- Install Apache:

```
sudo aptitude install curl apache2
```

## AREDN Node Configuration
