# **Linux Server**

## **Prerequisites**

Running a home Linux Server on AREDN is pretty simple.

- Install LinuxMint Xfce on a cheap laptop.
- Update it and reboot if necessary.
- Change the Linux hostname, which will identify the computer in various place on AREDN. I renamed mine VA7FI-Linux:

Last update: 2021/11/09 16:44

sudo hostnamectl set-hostname VA7FI-Linux

• Install Apache:

sudo aptitude install curl apache2

### Website

#### The html Folder

The website folder is located here: /var/www/html/ Anything you put in there (with the right permissions) will be visible to others on the AREDN network. Let's get a few things out of the way first.

• Create a link to your home folder for ease of access:

ln -s /var/www/html ~/

• Let's change the ownership of everything in that folder so we (the user) and the web process can access them easily. My username is a redn, which you should replace with your own username.

sudo chown aredn:www-data -R /var/www/html/

• Let's change the permissions:

sudo chmod 770 -R /var/www/html/

In general, those permissions are ok, but depending on what you're running as a web service, they could be too permissive. That being said, since we're not exposing our site to the open internet, we're probably ok with those.

### The index.html File

1)

We're now ready to write our fist webpage! You can delete the file index.html in the webfolder and create one of your own. There's a simple online html editor that's very convenient to use for small pages: simply edit the text you want on the left, and copy the html code on the right into your index.html file. Here's VA7FI's page as an example.<sup>1)</sup>
