AREDN

AREDN is a project aimed at using wifi devices to create a computer network independent of the internet.
 Since hams have access to sections of the 2.4GHz and 5.8GHz bands that regular wifi devices don't, those channels are quieter and longer distances can be achieved with better antennas.

Last update: 2021/07/31 16:01

- NARA on the island is leading the way in creating this network in our area, and a few people on the Coast have started experimenting with some of the equipment.
- This message board is very active with local hams and what they're working on.
- This map shows the nodes that are live in the area.
- This site is useful to model line of sight, including the formula Fresnel zone.

Getting Started

The easiest way to get started is to get a Microtik hAP AC Lite TC. Once flashed with the AREDN firmware, the device will use the 5.8GHz band as regular wifi for your computer to connect to, and the 2.4GHz band will be used to mesh with other devices within range. Realistically, the hAP is not useful to make long distance links since it would require an external antenna. But it is useful to tunnel to others on the network via the internet to get started with the system. To add RF links, an outdoor device can be connected to the hAP later. See the support matrix for more information.

Services

Once on the AREDN network, individuals can run different services on small servers like the Raspberry Pi. A few examples we have running right now are:

- VE7ODG's Mattermost service for chat. See here to sign up. You can also use a phone app instead of the web interface as long as your phone is connected to the AREDN network.
- The Island's VOIP phone network
- VE7LSE's Winlink gateway. 1)
- and more ...

Connection Between Nanaimo and the Sunshine Coast

On July 4, 2021, Chris (VE7TOP) and Patrick (VA7FI) made a successful connection on 5.860 GHz (Ch. 172) between Nanaimo (49.227263, -123.975836) and Roberts Creek (49.45465, -123.64199): a distance of 35 km.

VA7FI's Setup

Patrick installed a Mikrotik LDF-5 (the n model, not the ac model) on a used TELUS satellite TV dish.

s://scarcs.ca/howto/aredn?rev=1627772495	Last update: 2021/07/31 16:01
• The first task was to mount the LDF-5 to the dish roughly where the old receiver and the LDF-5 mounting bracket were both a bit too short so the LDF-5 was too c	•
• So a second arm was bolted on top of the first to raise the LDF-5 and move it a bi	it further away:
 Initially, the dish was mounted on a post with a 45° angle, but after field testing i unnecessary and a vertical post will be used next time. x 	t, it was found to be
• Here's Patrick's setup and the view from the dish. The red circle marks the spot w	vhere Chris is. The log

periodic was for VHF communications between Chris and Patrick to perform the adjustments.

- Here are Patrick's settings:
- Fix Me! add details). After adjusting the dish's • For the first test, Chris used a dish (directions and elevations, the best signal strength received by Patrick was above -60dBm (which is pretty impressive!) with an SNR of over 35dB:
- For the second test, Chris switched to a 120° sector antenna (the best signal strength received by Patrick was a bit above 80dBm with with an SNR of about 17dB:

These two tests show that it is possible to establish a connection between Nanaimo and the Sunshine Coast. The 120° sector antenna might be pushing it a little bit, but a 45° sector antenna would be enough to cover Gibsons through Sechelt and would offer an additional 6dB of gain over the 120° sector antenna.
