

Fresh LinuxMint Install

- Change Hostname to VA7FI-Linux because that'll be the Node name on Mesh chat:

```
sudo hostnamectl set-hostname VA7FI-Linux
```

Install Meshchat

```
our $pi_zone = 'MIMeshChat';
our $local_meshchat_node = '<IP Address from AREDN>';
</code bash>

===== Tests =====
* [[http://localhost/meshchat/]]
* [[http://<ip from AREDN>/meshchat/]]

===== Problem 1 =====
"Lock Error" Ref: [[https://www.arednmesh.org/content/pi-meshchat-error-sending-
message]]

Looking in '/var/log/apache2/error.log', I see many of:<code bash>
touch : cannot touch '/tmp/meshchat/lock' : No such file or directory.
could not get lock at /usr/lib/cgi-bin/meshchatlib.pm line 35
```

Issue is that apache doesn't allow use of /tmp folder. So created these:

```
sudo mkdir /var/www/html/meshchat/tmp/
sudo mkdir /var/www/html/meshchat/tmp/meshchat/
sudo chown www-data:www-data -R /var/www/html/meshchat/tmp/
sudo chmod 770 -R /var/www/html/meshchat/tmp/
```

Edit config file to update location of /tmp folder:

```
sudo pico /usr/lib/cgi-bin/meshchatconfig.pm
```

And replace every instance of /tmp/ by /var/www/html/meshchat/tmp/

Restart services:

```
sudo systemctl daemon-reload
sudo /etc/init.d/apache2 restart
sudo /etc/init.d/meshchatsync restart
```

Problem 2

Not getting chats from other MIMeshChat instances
